

FACTORY

The quality of CZ's products and service delivery reflects the facility from which they were born – a facility that matches or exceeds international standards to produce products of the same caliber.

CZ has invested heavily in its infrastructure to create a modern and technologically advanced facility with the aim of better serving our clients and constantly evolving with today's advanced electronics.

INTEGRATED ACCESS

CZ's 8,000 m² factory is based in Ekurhuleni on Johannesburg's east rand. Conveniently situated amidst a comprehensive transport network including road, rail and a major international airport, CZ is able to ship orders seamlessly and via the most appropriate transport channels.

An increase in available floor space was recently commissioned to allow for expanded production capacity and testing and storage facilities. Our factory houses end-to-end business functions, including production to testing, warehousing to distribution and administration to stores.

DRIVING EFFICIENCY

The all new Process machines use less energy than the current legacy machines. Optical solder and component inspection have greatly improved quality and we have seen a 20% reduction in re-work. This gives CZ major efficiency improvements with associated cost savings in re-work and scrap costs.

The upgraded factory layout and component carries ensure that product moves efficiently from station to station reducing work transfer costs and the damage risks associated with moving items around a factory during the manufacturing process.

CZ's strategy to keep skills and infrastructure on the continent has proved to be boon for local business and industry by providing world class facilities, producing comparable products bolstered by a competitive economic landscape.
